

TRACEABILITY IN ALBERTA

RELIES ON THREE PILLARS

PREMISES IDENTIFICATION

Premises Identification (PID), is a way of linking livestock and poultry to land locations. The information collected through the Alberta Agriculture and Forestry Premises Identification System allows industry and government to locate animals more quickly and accurately to confine a disease outbreak or emergency such as a flood or fire. Animal owners can be notified if an emergency might affect their animals and operation but this can only be accomplished if land locations are registered in the Premises Identification System.

ANIMAL IDENTIFICATION

Animal Identification is the ability to identify individual animals or groups of animals. Animal identification works with the other pillars of traceability, premises identification and animal movement, to track where animals have been transported and when. Animal identification helps industry and government to locate animals to confine a disease outbreak more quickly and accurately.

ANIMAL MOVEMENT

Animal Movement is the act of tracing livestock and poultry backwards or forwards through the production supply chain based on animal movement records. Movement records are vital because the faster we can locate where livestock has been, the more effectively we can determine which livestock are at risk of being affected in a disease outbreak.
